Are Ebay reviews trustworthy?

So, I just recently started looking at EBay. Before, my entire perception of eBay was predisposed to thinking everything is a scam, it doesn't work, or it's overall just awful. But, I started looking around, and I am filled with curiosity.

One of my biggest concerns is that sellers and products pretty much always have very high positive feedback. Why is this? On amazon that I use a lot, the average rating is probably like 4.2/5 or something. But on eBay, I see 100% all the time for people with tons of reviews. Can eBay reviews easily be totally faked? How do I know what is actually real? I just want to know if you guys think reviews are reliable on eBay?

Also, how do reviews of products work? I've seen single amount items being sold by an individual on the page with the same reviews as those from another seller, which seems sort of confusing to me since the product being sold is not the one that there are reviews there for.

No eBay reviews can't be faked. I have over 1100 positive feedback and only a small percent actually leave me feedback. But why would I have bad reviews. I am honest. I ship fast. I take lots of photos. My customers are happy. Too many negatives I would lose my account. Maybe Amazon needs to ban crappy sellers if they are allowing a lot with bad feedback.
